

Team Processes

Discussion 02

Readings

These reading selections cast our nets wide (but shallow) to get an introduction to some of the most widely adopted team processes that are commonplace in modern software development. Both readings come from Software Engineering (Sommerville). The Ch.2 selection focuses on development methodologies, and the Ch.3 selection focuses on team processes from a few different angles.

Required

- 1) Software Engineering, Ch.2 Introduction through Section 2.1 (11 pages)
- 2) Software Engineering, Ch. 3 Introduction through Section 3.3 (16 pages)

Recommended

The book goes into further depth on these topics later, but we will specifically target some of the readings later in the course. I suggest looking for real companies or people that have used these development methodologies and decided what has been best for their own projects. This may take the form of books, interviews, podcasts, web articles, etc., but you will have no problem finding opinionated people regarding these topics! You might also be on the lookout for more concrete examples for some of the topics discussed, as the book is very light on visualization.

Learning Outcomes

- Describe three software development projects where each is better suited for a different SDLC model than the others, justifying the model chosen for each
- Compare an agile approach to software development to a plan-driven approach
- Evaluate the pros and cons of at least four agile practices that Extreme Programming introduced into mainstream software development culture
- Differentiate the related terms “Agile”, “XP”, and “Scrum” with regards to the role each plays in software development
