

Work Sequencing

Discussion 12 – CSC 4033

Readings

Our reading selection from “User Stories Applied”, by Mike Cohn, describes work sequencing processes that are closely related to Scrum, but keep in mind that they are conceptually different. The two are often used in combination, but we will explore that connection in more detail when the project begins. If you’re too curious to wait, check out the recommended reading selection!

Required

- 1) User Stories Applied, Ch.8 (7 pages)
- 2) User Stories Applied, Ch.9 (9 pages)
- 3) User Stories Applied, Ch.10 (6 pages)

Recommended

- 1) User Stories Applied, Ch.15

There are many different versions of the processes described in our reading selections, so looking around online is sure to yield some interesting takes and insights on it all. Soon you’ll have a chance to form your own opinions on our in-class version for the upcoming project!

Learning Outcomes

- Discuss the process of estimating stories with story points and recommended best practices for making estimations
- Explain what should (and shouldn’t) be inferred from story point estimates
- Explain how the desired scope, priorities of stories, and expected time are taken into account when planning a software release
- Discuss the activities involved in iteration planning
- Explain the kinds of adjustments a team might need to make during an iteration or release when reality deviates from the expected plan
