

Refactoring and Code Evolution

Discussion 14 – CSC 4033

Readings

Our final reading selections are from [Software Engineering at Google](#), by Titus Winters, Tom Manshreck, & Hyrum Wright, and [Software Engineering: A Modern Approach](#), by Marco Valente. Think critically while you read about how these ideas do (or don't) apply to projects you've personally worked on (school/work/personal) and how you might apply them in the future.

Required

[Software Engineering at Google, Ch.1 – Time and Change](#), (~6 pages)

[Software Engineering: A Modern Approach](#), Intro-9.2 (~17 pages)

Recommended

- Refactoring: Improving the Design of Existing Code (Ch.6), by Martin Fowler
- The remaining parts of the chapter for both required readings (for additional context)

Learning Outcomes

- Explain the idea of Lehman's Laws and how they relate to refactoring [SE-Refactoring: 3.a]
- Contrast writing code that "works now" versus code that "works indefinitely" [SE-Refactoring: 1]
- Explain Hyrum's Law [SE-Refactoring: 1]
- Discuss how Hyrum's Law applies (or doesn't) to projects you've worked on in the past and your upcoming senior capstone project [SE-Refactoring: 1]
- Describe at least five refactoring strategies, including a summary and example application for each [SE-Refactoring: 3.a]
